Supplementary K-12 School Information – October 23, 2020

In addition to the data provided in the Weekly Surveillance Report, Gallatin City-County Health Department (GCCHD) will provide schools with the data necessary to measure where our community stands in regard to the CDC’s “Indicators for Dynamic School Decision Making.”

**CDC Guidance for School Operations**

The document recommends three “core” indicators to help school officials decide whether to open, close, or re-open schools. These core indicators include two measures of community disease burden (number of new cases per 100,000 persons in the past 14 days; and percentage of RT-PCR tests that are positive during the last 14 days) and one self-assessed measure of school implementation of key mitigation strategies.

**New cases per 100,000 persons in the past 14 days:** In Gallatin County, our best local data shows that we have 716 new cases per 100,000 persons during the 14 days that ended on 10/22/2020.

**Percentage of RT-PCR tests that are positive during the last 14 days:** In Gallatin County, our test positivity rate for two week period that ended 10/19/2020 was 10.2%. Public health experts suggest a positivity rate above 10% may indicate a significant number of cases in the community are not being detected.

It should also be noted that the 7-day rolling average for test positivity rose to 13.6% during the period that ended 10/19/2020, up from 11.0% on 10/12/2020. This indicates a rising test positivity trend over the past week.

Once we have cases with exposure in schools, we would expect to see greater numbers of students and staff that need to be in quarantine in schools that have greater numbers of students in classrooms. This trend will likely accelerate as we have cold weather and more students have symptoms and are tested for COVID-19.
**Secondary CDC indicators:** The CDC guidance identifies a number of secondary indicators. These include the percent change in new cases per 100,000 population during the last 7 days compared with the previous 7 days. This is a measure designed to gauge the trajectory of our local epidemiology, whether our local case numbers are rising or falling. In Gallatin County, the most recent 7-day period (ending 10/22/2020) produced 419 cases per 100,000 residents. That was 41% higher than the prior 7-day period.

</table>

The CDC guidance also refers to the presence of localized community/public setting outbreaks, characterized as a sudden increase in the number of COVID-19 cases in a localized community or geographic area as determined by the local and state health department. Locally, we have experienced rapidly rising case numbers in the past 72 hours, recording a total of 261 cases as of 10/22/2020.

Finally, the CDC guidance refers to a number of measures of local capacity within hospital and intensive care units. As of October 23, Gallatin County has nine hospitalizations related to COVID-19 and the overall hospital census includes 55% occupancy of critical care beds and 97% of non-critical care beds (Bozeman Health Deaconess Hospital and Big Sky Medical Center). The two figures below describe the percentage of occupied and open critical care and non-critical care beds at Bozeman Health Deaconess Hospital and Big Sky Medical Center as of 10/23/2020.
While the rising percentage of beds occupied in non-critical care settings is noteworthy and will be monitored closely, Bozeman Health officials are confident in the hospital’s current capacity to care for patients. These census figures fluctuate significantly day-to-day, particularly this time of year.

Please note the data contained in the report above are subject to change as more information regarding cases and lab tests become available through contact tracing or information sharing. GCCHD reserves the right to edit the format and content of this school supplement.
